

Stochastic homogenisation of high-contrast media

Kirill Cherednichenko (University of Bath)

Abstract

Using a suitable stochastic version of the compactness argument of [V. V. Zhikov, 2000. On an extension of the method of two-scale convergence and its applications. *Sb. Math.*, **191**(7–8), 973–1014], I will discuss a probabilistic framework for the analysis of heterogeneous media with high contrast. I will show that an appropriately defined multiscale limit of the field in the original medium satisfies a system of equations corresponding to the coupled “macroscopic” and “microscopic” components of the field, giving rise to an analogue of the “Zhikov function”, which represents the effective dispersion of the medium. I will also demonstrate that, under some lenient conditions within the new framework, the spectra of the original problems converge to the spectrum of their homogenisation limit. This is joint work with Mikhail Cherdantsev and Igor Velčić.
